

Hollow Core Slab Systems

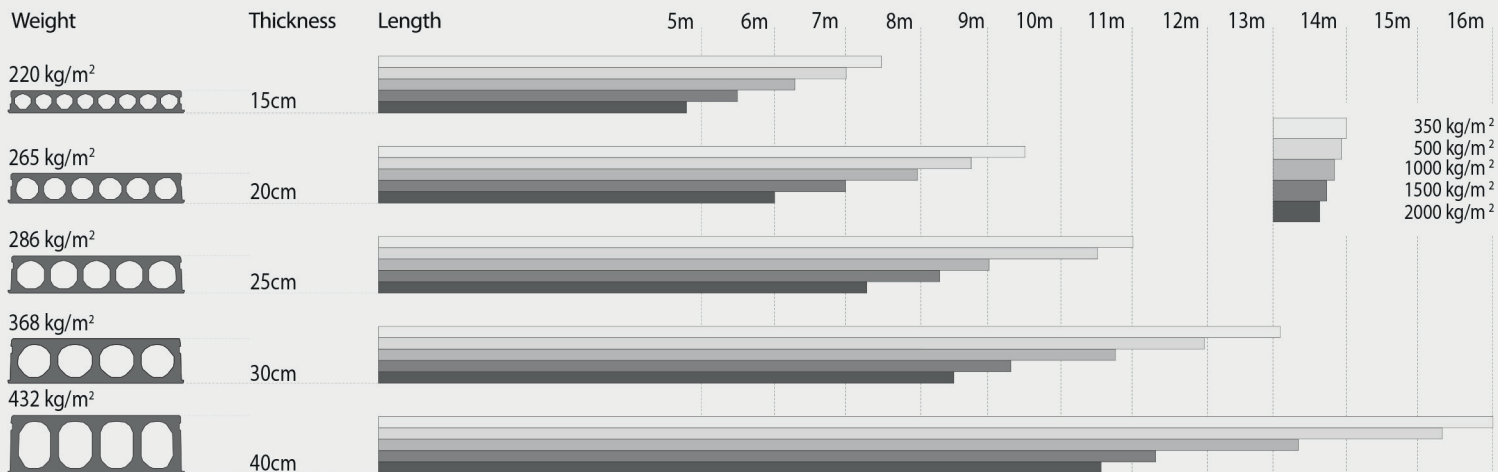

KAMBETON

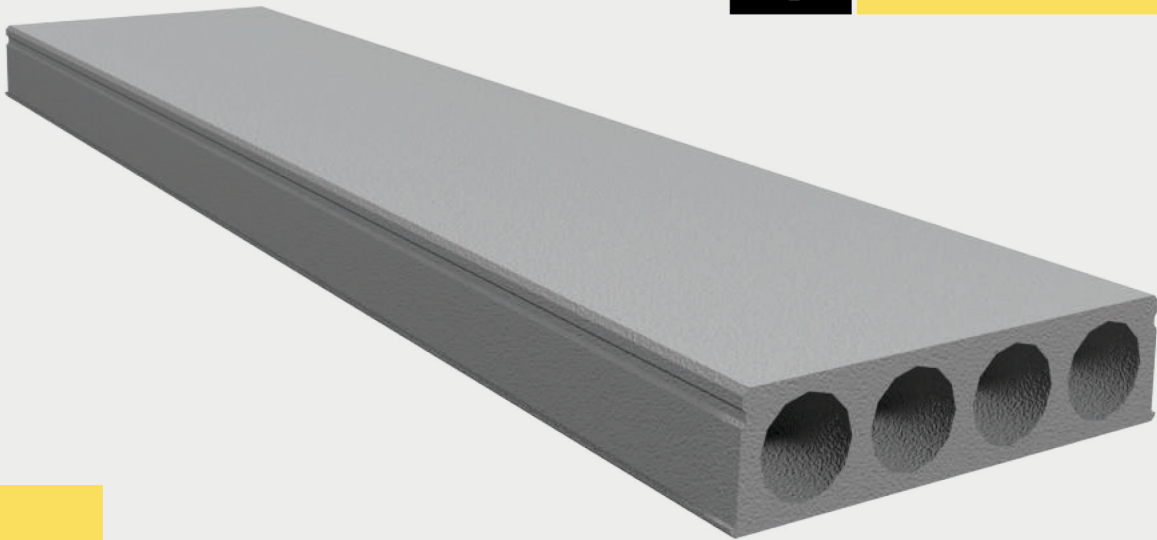

Hollow core slabs are prestressed with steel strands. Strict quality controls are applied to achieve high durability.

Hollow Core Slabs are produced with a standard width of 120cm but can be cut in desired width and lengths. The bottom surface has a smooth finish and therefore no further application is needed after installation.

The longitudinal voids/cores contribute to thermal and sound insulation and can also be used as ducts for services such as electrical cables.

Clear,
Longer Spans

Economical,
Lighter Solution

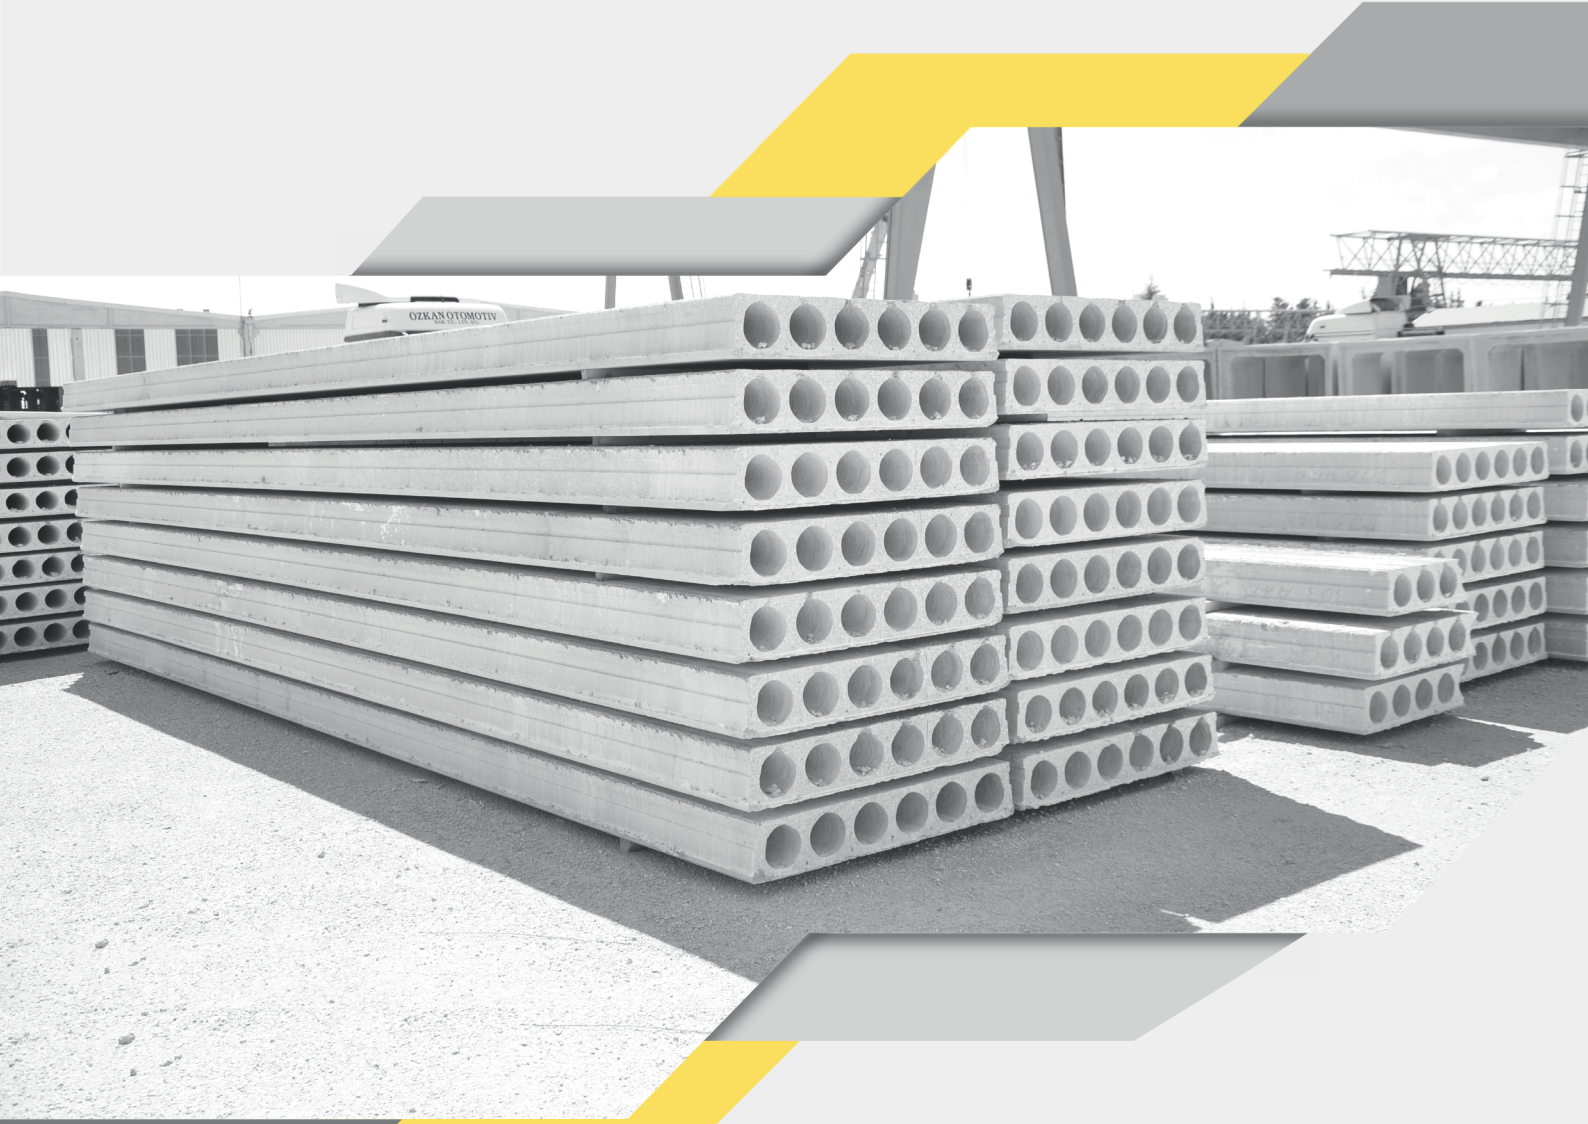

Rapid,
Safe Installation

Hollow core slabs can achieve spans up to 16 meters depending on the live load. Long clear spans eliminate columns and allow for larger open areas which are crucial for retail spaces.

The longitudinal voids within the slabs reduce self-weight, therefore lightening the load on the structure and reducing the total construction costs.

Hollow core slabs can be installed safely and quickly without the need for scaffolding on site, shortening the overall construction time.
